Eclipse SUMO Project

Simulation of Urban MObility

Welcome to Eclipse SUMO (Simulation of Urban MObility), an open source, highly portable, microscopic and continuous multi-modal traffic simulation package designed to handle large networks.

SUMO 1.7.0 for Windows 64bits
Latest Development Version (Nightly Snapshots)
Older releases

Registration is now open!
The SUMO User Conference 2020 takes place October 26-28, 2020. This year's conference is going to be online and the participation will be free of charge. More info about the conference

Open Source since the beginning

- Used world-wide, especially in the scientific community
- 26k hits on Google Scholar for 'sumo traffic'
- #Downloads 2019: > 50 000
Driving Simulation
Virtual test driving in complex surrounding traffic with DYNA4 and SUMO

Integration of SUMO traffic simulation into DYNA4 vehicle and environment simulation for virtual development and testing of driver assistance systems (ADAS) and autonomous driving functions.

Applications

- Development and test of driver assistance systems
- Development of autonomous driving and Car2X
- Virtual validation of AI functions
- Development of intelligent transportation systems
ADD TRAFFIC AND PEDESTRIANS TO YOUR TESTING

For many types of testing it is important to populate your virtual test routes with accurately modelled traffic and pedestrians, for example, the testing of ADAS and Autonomous systems, or simulated RDE test runs.

rFpro allows you to populate the virtual test world with intelligent traffic, from swarm tools such as SUMO and PTV-Vissim. It also allows you to create specific scenarios, such as a potential collision at an intersection, using tools such as CarMaker Traffic, or even under direct control via Simulink IO Block. rFpro passes the details of the human test driver’s car to the traffic systems, so that the intelligent traffic avoids and gives way to the vehicle under test.
CARLA 0.9.8 release

CARLA and ROS Debian packages, night mode, weather extension, improvements on the traffic manager, new documentation, SUMO co-simulation and much more.

Posted by @sergi-e on March 09, 2020

The CARLA team is delighted to finally announce the release of **CARLA 0.9.8**!

This release makes for a new CARLA experience, bringing improvements to well established modules, along with a bunch of new features. Among these features we would like to highlight the new installation method using deb packages for Ubuntu. A new repository provides deb packages for the CARLA simulator and the ROS bridge, which can be easily installed using apt.
Automated Mobility District “Digital Twin” Provides Insights for Urban Transportation Systems

Sept. 15, 2020

“[...] Overall, the AMD modeling and simulation toolkit offers insights into a range of mobility options not covered by previous transportation analysis models. The toolkit builds on the existing open-source Simulation of Urban Mobility (SUMO) package and the Future Automotive Systems Technology Simulator developed at NREL.”

The Automated Mobility District Toolkit acts as a decision-making resource for implementing emerging mobility systems, such as this automated electric vehicle at the NREL campus. Photo by Dennis Schroeder, NREL

6. Use SUMO to evaluate my fleet scheduling
Achievements – User Story #1

use Google satellite pictures as background in Netedit and in SUMO Gui #1

behrisch commented on 13 Aug 2019

As a
Advanced user

I want to
use Google satellite pictures as background in Netedit and in SUMO Gui

In order to:
- ease map editing work in case of real world scenarios
- create such simulations, where the vehicles move 'likely' on the real world roads

Acceptance criteria
if there is a geo-referenced network loaded in Netedit or SUMO Gui, I can choose Google satellite pictures as background, as an alternative of background decals
